Exploring Rocks, Fossils and Landscape of The Lake

rocks. Fossils are the remains or imprints of plants and animals that lived long ago. These imprints or remains get preserved in Earth's crust. **Body Fossils** These are stone imprints, molds, or casts left by organisms that were once living. They include animals, plants, and people. Single teeth or bones are body fossils, too. **Trace Fossils** Footprints, tracks, eggs, and fossilized excrement ...

The PDF file containing this unit study is graphic intensive and full color. In addition, the PDF contains all of

the links needed for the Internet activities.

Earth Science: Soils, Rocks, Minerals and Fossils

the three main rock types, with older students exploring the rock cycle and some of the main processes by which rocks are transformed from one type into another. Æ Students then consolidate their knowledge, using the key card to classify rocks that are more difficult to sort. Æ Younger students can finally check their understanding of the differences by sorting rocks, fossils and man-made ...
