Fatigue life. The American Society for Testing and Materials defines fatigue life,  $N_f$ , as the number of stress cycles of a specified character that a specimen sustains before failure of a specified nature occurs. For some materials, notably steel and titanium, there is a theoretical value for stress amplitude below which the material will not ...

Fracture strength, also known as breaking strength, is the stress at which a specimen fails via fracture. This is usually determined for a given specimen by a tensile test, which charts the stress-strain curve (see image).

Fracture healing in a broken bone is quite a complex process that begins by hematoma formation, a collection of inflammatory agents which render the bone forming cells to form bone tissue to bridge the defect created by fracture.
